

Python for Data Analysis

ESILV 2023–2024 [Tutorial : Scikit-learn]

Supervised Learning

Exercise 1

- 1. Load and return the boston dataset from sklearn.datasets.
- 2. Split the boston dataset into train data and test data.
- 3. Standardize the data.
- 4. Train or fit the data into a model using the Support Vector Machine Algorithm and test it.
- 5. Select best hyperparameters of the model using GridSearch.
- 6. Create a function to test the different hyperparameters.
- 7. Train or fit the data using other algorithms.
- 8. Compare the performance of the different algorithms. Which is the best Model?

Exercise 2

- 1. Load and return the dataset titanic from Seaborn library.
- 2. Use different machine learning models to predict the Survival of Titanic Passengers.
- 3. Which is the best Model?
